

Tips to reuse waste water from RO

Using a reverse osmosis (RO) water filtration system has brought us many conveniences. However, for every 1 liter of purified water, 3 liters of water are wasted.

- ✓ **Washing utensils** – Collect the waste water from RO. It can be used to wash utensils or at least for soaking them before washing.
- ✓ **Car washing** – Your car would need to be washed regularly. Why not use RO waste water for this purpose?
- ✓ **Gardening** – Test using the waste water from RO on your house plants and use it for the plants that react well to it.
- ✓ **Flushing toilets** – The RO waste water may not be very good to bathe or wash your hair with but you can certainly use the water to flush your toilets. Some houses have a separate tank for collecting the waste water from RO which is connected to the toilet flush.
- ✓ **Desert coolers** – Use this water for desert coolers to keep you cool in summers. You may need to regularly clean the pipes for any salt deposits.

✓ **Fountains or home décor** – If you use water for home décor like floating flowers or floating candles or small fountains then you may use waste water from RO for this purpose.

✓ **Cleaning your terrace, backyard** – Generally the terrace or backyard is made up of concrete, stone or tile, so using RO waste water for cleaning such surfaces will not result in salt stains.

✓ **Mopping the floor** – RO waste water can be used to mop floors. If you are concerned about salt deposits, you may use this water only on alternate days.

✓ **Washing clothes** – If you do not want to risk your good clothes, use this water either for soaking clothes before washing or to wash clothes like socks and home wear.
